

Figure 18. Model Execution Options

In this menu, the user can select whether to use WinCrew built-in algorithms to modify task time and accuracy associated with experience, aptitude, and fatigue. Also, the user can turn on or off workload strategies. By turning this off, the model will not simulate modifying operator behavior in high workload situations using workload management strategies. Selecting animation will allow a display of the task network as it runs with animation. Animation involves highlighting tasks as they are executing as shown in Figure 19.
