Motivation: Training Objectives

- **Military forces operate in complex and dynamic environments [1] where bad decisions might have fatal consequences.**
- **Many of the virtual training are designed without thorough consideration of the effectiveness and efficiency of embedded instructional strategies [2], and without considering the cognitive capabilities and limitations of trainees.**
- **As highlighted in [3], large military training exercises require a significant commitment of resources, and to net a return on that investment, training scenarios for these events should systematically address well-specified training objectives, even if they often, do not.**

Summary

- We present a design solution for a proof-of-concept prototype that visualizes and manages training objectives and performance measures, at individual and collective levels.
- We present a task analysis study with experts from Combitech and Saab Training.
- Focus on visualizing **training objectives and training models**.
- Real-world data from Live training exercises.
- Discussion how to learn from previous training experiences using data mining methods in order to build training models to provide instructional personalized feedback to trainees.

DESIGN PROCESS

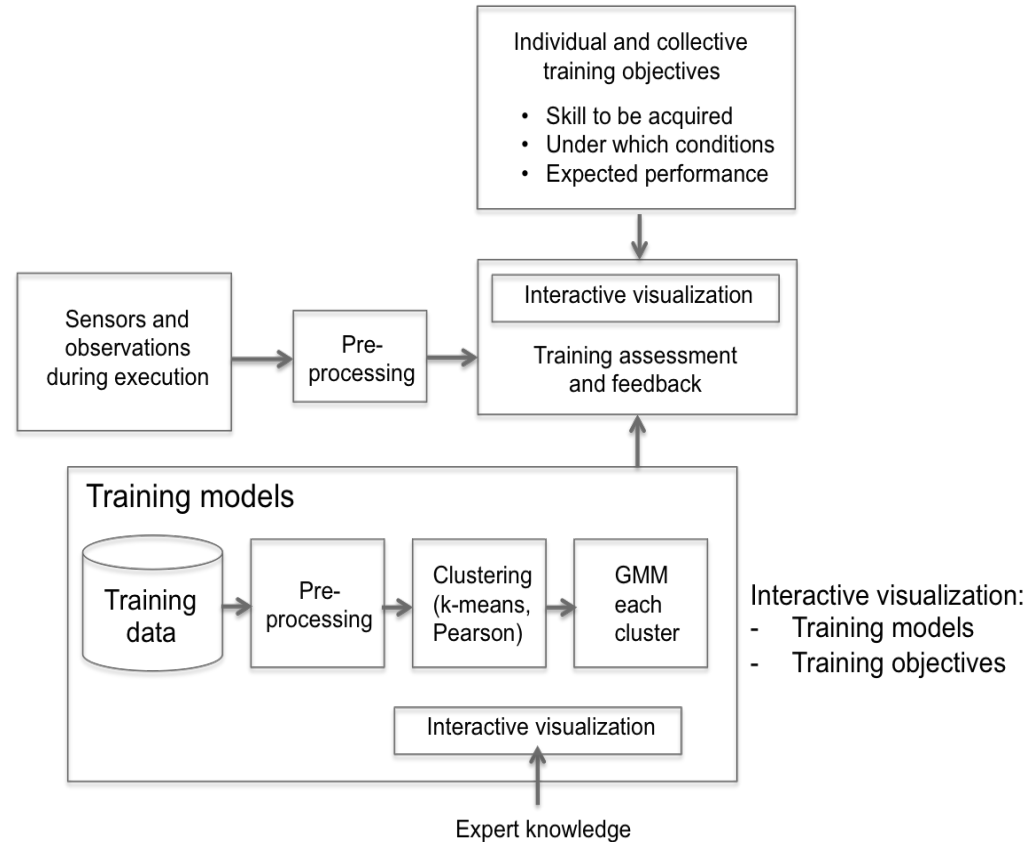

Design process used in this work, adapted from Offermann et al. [4]

TASKS TO BE SUPPORTED

The formative user study carried out with expert system developers and experts in training highlighted that the following tasks needed to be supported:

- ① Identify different groups of trainees.
- ② Create statistical models that characterize each of the identified groups.
- ③ Define training objectives (skill, conditions and expected performance).
- ④ Interactive support for after-action support:
 - a. what happened?
 - b. why did it happened
 - c. how do we improve it in the future?
- ⑤ Support for comparison tasks both at the individual and collective level: compare results with training objectives and training models.
- ⑥ Play back multimedia data associated to exercises, combining all the information collected and the information from the aforementioned tasks.
- ⑦ Highlight differences and similarities between groups of trainees.
- ⑧ Provide feedback based on the models and the expected results, both at individual and collective level.

PROTOTYPE DESCRIPTION

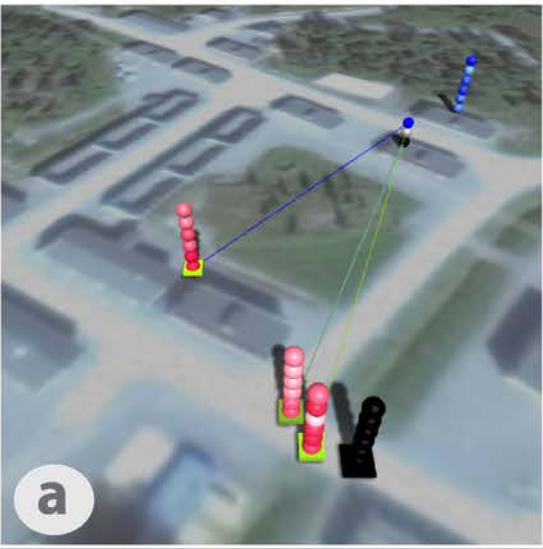

System architecture: (1) sensor observations, pre-processing, training assessment and feedback; (2) training models; (3) individual and collective training objectives. The analysts can interact with the various the modules.

PROTOTYPE DESCRIPTION

Selected player: Soldier_223 Interpolate

3D Follow selected

(a)

Player status

name: Soldier_223
health: healthy

Fired rounds
Near miss: 0
HK 416: 0

(b)

Summary training

Feature:

- Hit rate
- Fired rounds
- Remaining rounds
- Detonation result

Training objective: Skill: firing
Conditions: vehicle, team, ammunition type, events, player category

Individual training objective

Expected performance:

Result:

Collective training objective

Expected performance:

Result:

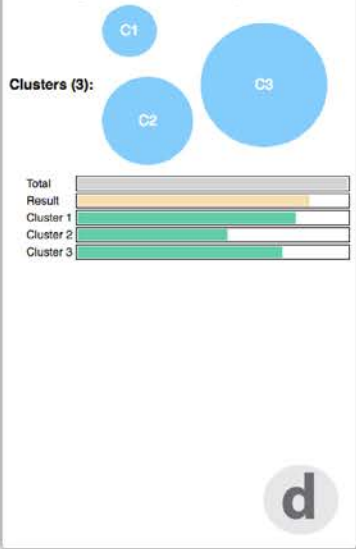

Individual vs. Collective training objective

Collective 2D view with details for the selected player.

PROTOTYPE DESCRIPTION

From left to right, real time performance data, comparison between expected and achieved results, visualization of training objectives and groups of trainees (clusters) found in the historical data.

CONCLUSIONS

- **CONTRIBUTION:**
 - **Design proposal of a training proof-of-concept prototype that allows the interactive analysis of high-dimensional spatio-temporal data and manages training objectives for performance evaluation of training exercises.**
 - **Tasks being supported were outlined after a formative user study with experts from Combitech and Saab Training.**
 - **The prototype uses historical data for building models of training behaviour that then are compared with the results of training exercises in order to provide personalized feedback.**
- **FUTURE WORK:**
 - **Natural more engage ways of interacting with data**
