## INTRODUCTION

### Military Relevance

**NATO develops capabilities to be ready, on a case-by-case basis and by consensus, to contribute to effective crisis management and disaster prevention. This enables the Alliance to actively engage in crisis management and disaster response, including non-Article 5 crisis response operations. The Alliance is therefore encouraging the joint training of military and civilian personnel to help build trust and confidence.**

### Participant Nations

CMDR COE (chair), DEU (co-chair), AUT, BGR, SLO, USA, JFTC, NCIA, ACT

### Industry

IABG, MASA, Bohemia Interactive

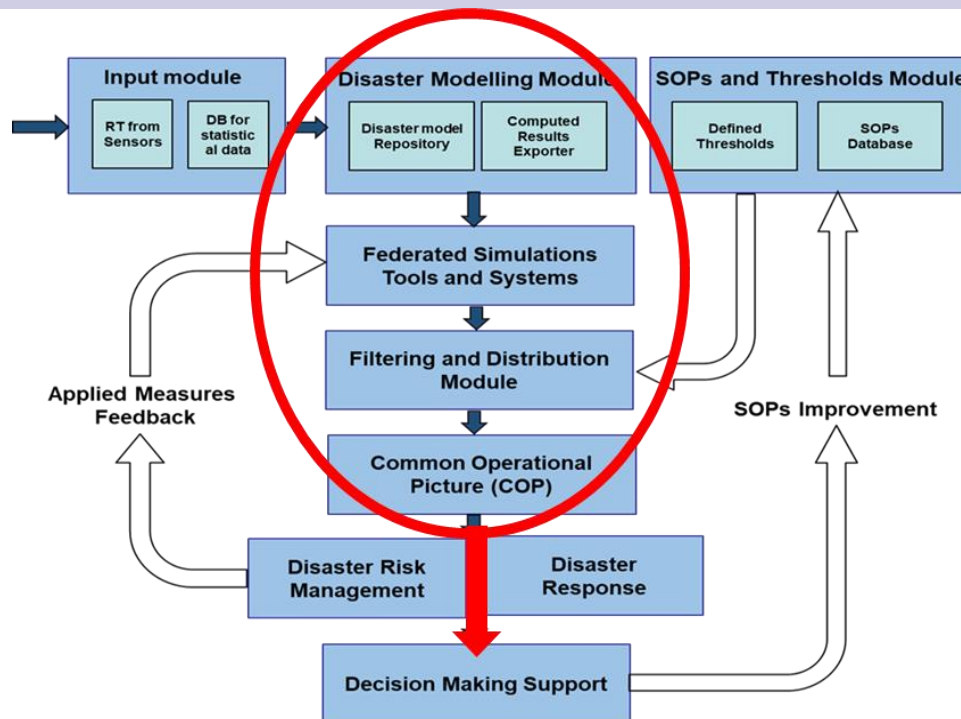

### Academia

University of Bundeswehr, University of Genoa, Bulgarian Academy of Science, BGR National Institute of Meteorology and Hydrology, JFTC, CMDR COE, M&S CoE, JCBRN-D COE, DAT COE

## Aim of the Project

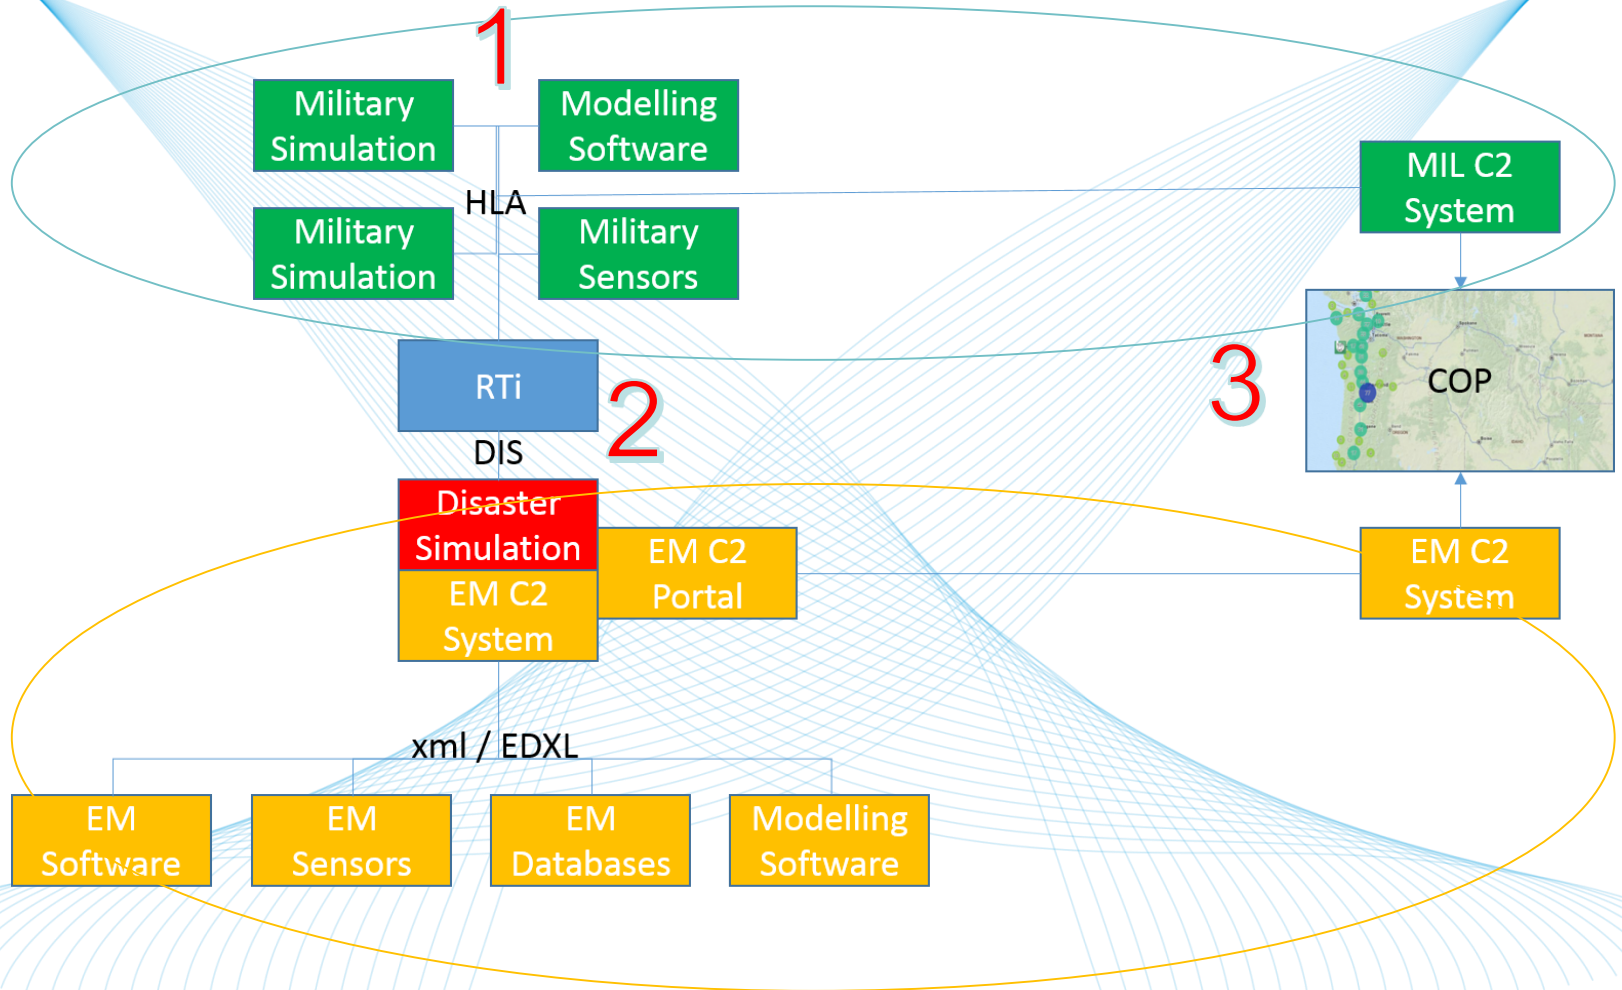

The aim of the project is to develop a **proposal** technical platform capable of supporting and conducting crisis management and disaster response exercises, analysis and preparatory training.

The intended result is to support military (NATO) decision making on the basis of prediction, analysis and visualization of effects in order to foster Courses of Action (CoA) in the light of a disaster.

## CONCEPTUAL MODEL

# Defined GAPS

## LOEs Details

### Dates:

- LOE 1                    20 – 24 March 2017                    – CMDR CoE, Sofia Bulgaria
- LOE 1a                    16 – 20 October 2017                    – JFTC, Bydgoszcz, Poland
- LOE 2                    15 – 19 October 2018                    – CMDR CoE, Sofia BGR
- LOE 3 pre-test        07 – 11 October 2019                    – JFTC, Bydgoszcz, Poland
- LOE 3                    20 – 24 January 2020                    – CMDR CoE, Sofia BGR

**Scenario Terrain and ORBAT:**

Bulgaria, CIV and MIL units in Coy size

**Test Cases:**

CBRN, Wildfire and Flooding

**Simulation Systems:**

JCATS, KORA, SWORD, CMDR IDE

**C2 Systems:**

IBM-IOC, IGeoSit, FIS H, SitaWare

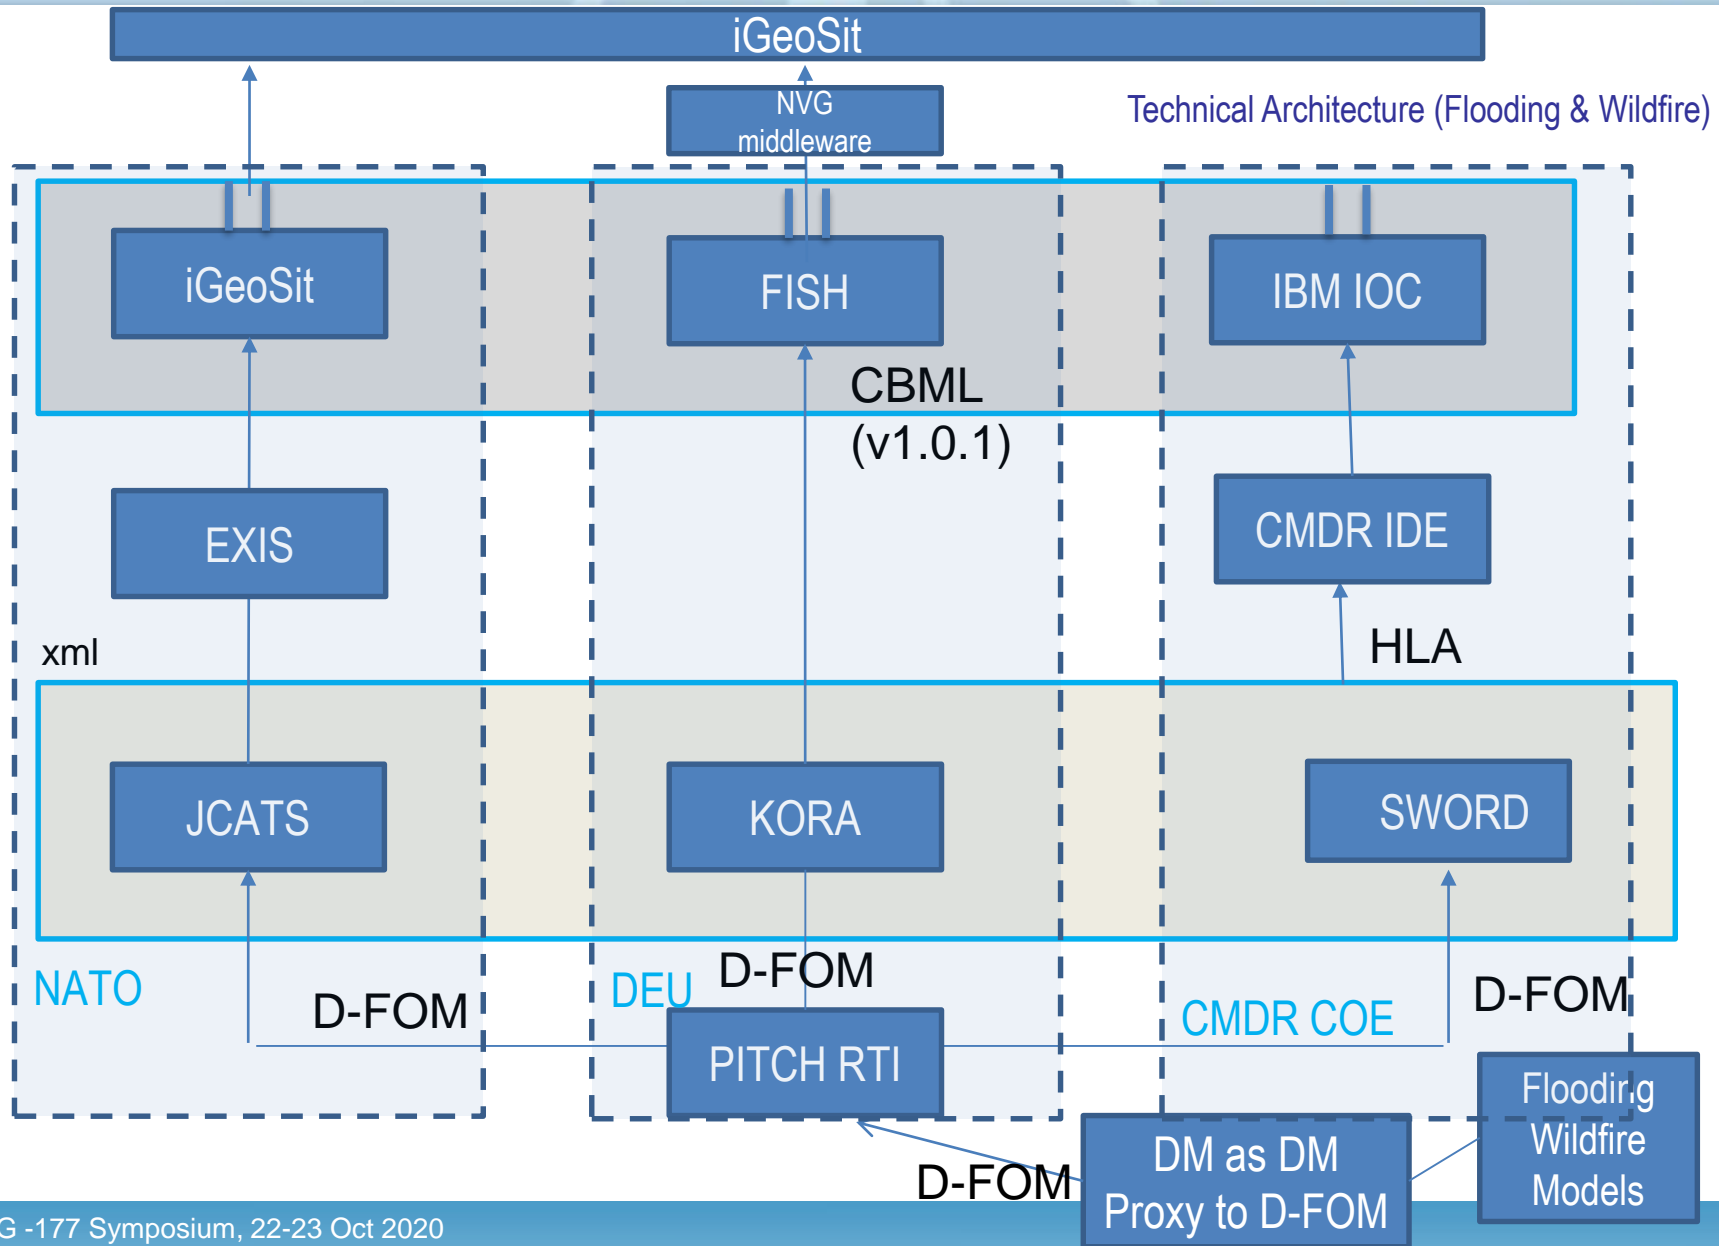

**Predictive Tools:**

CBRN → HPAC,

Flooding, Wildfire → CMDR IDE, KORA (exp only)

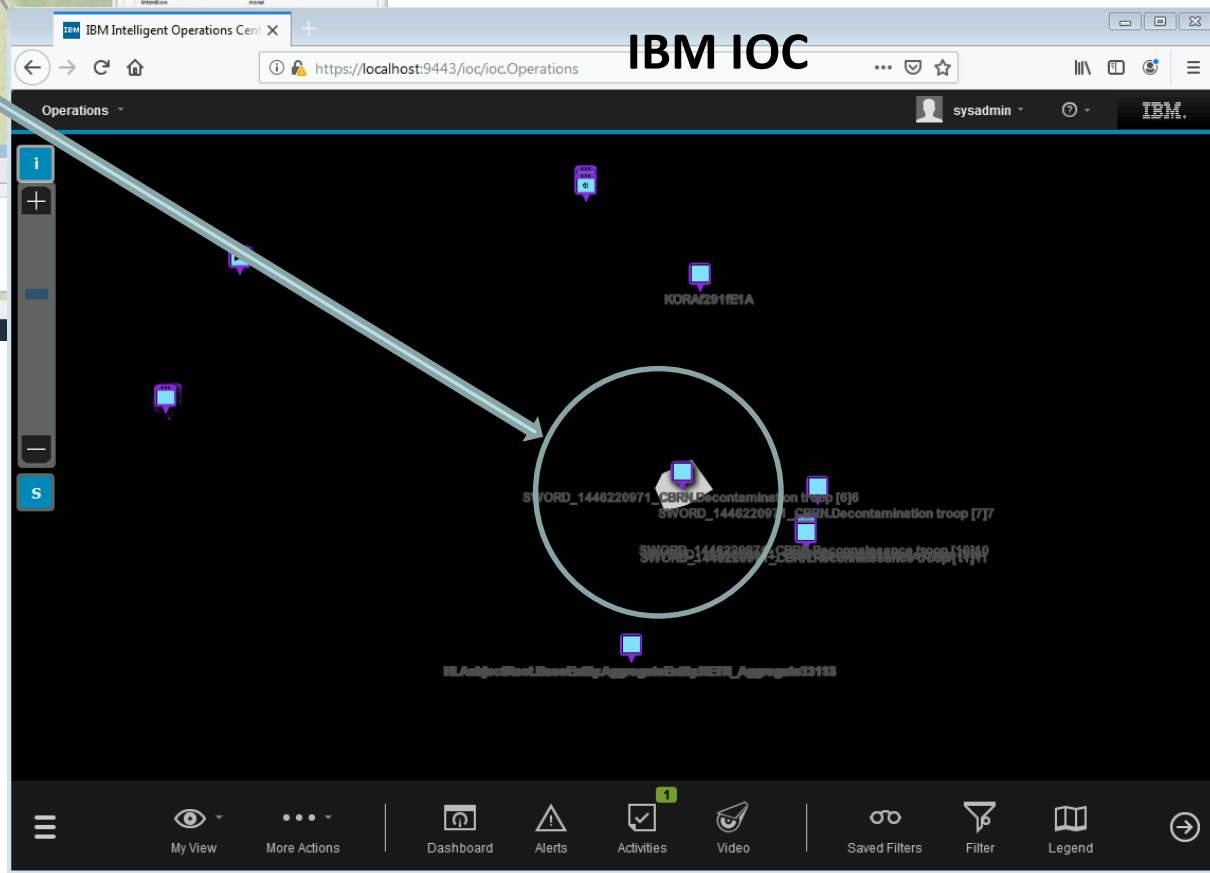

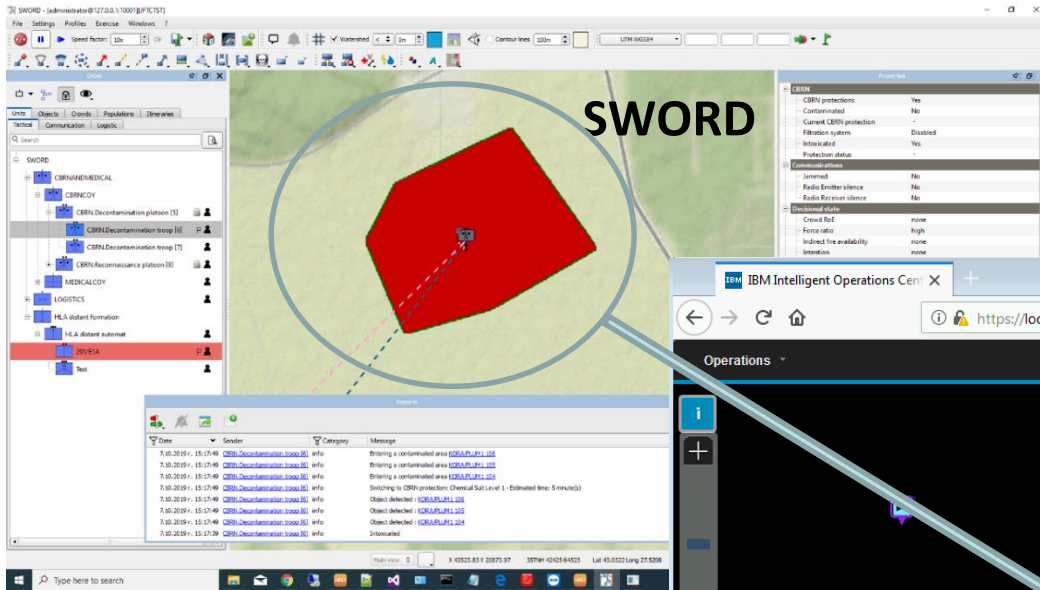

**Architecture & Test Cases**

Proof of concept

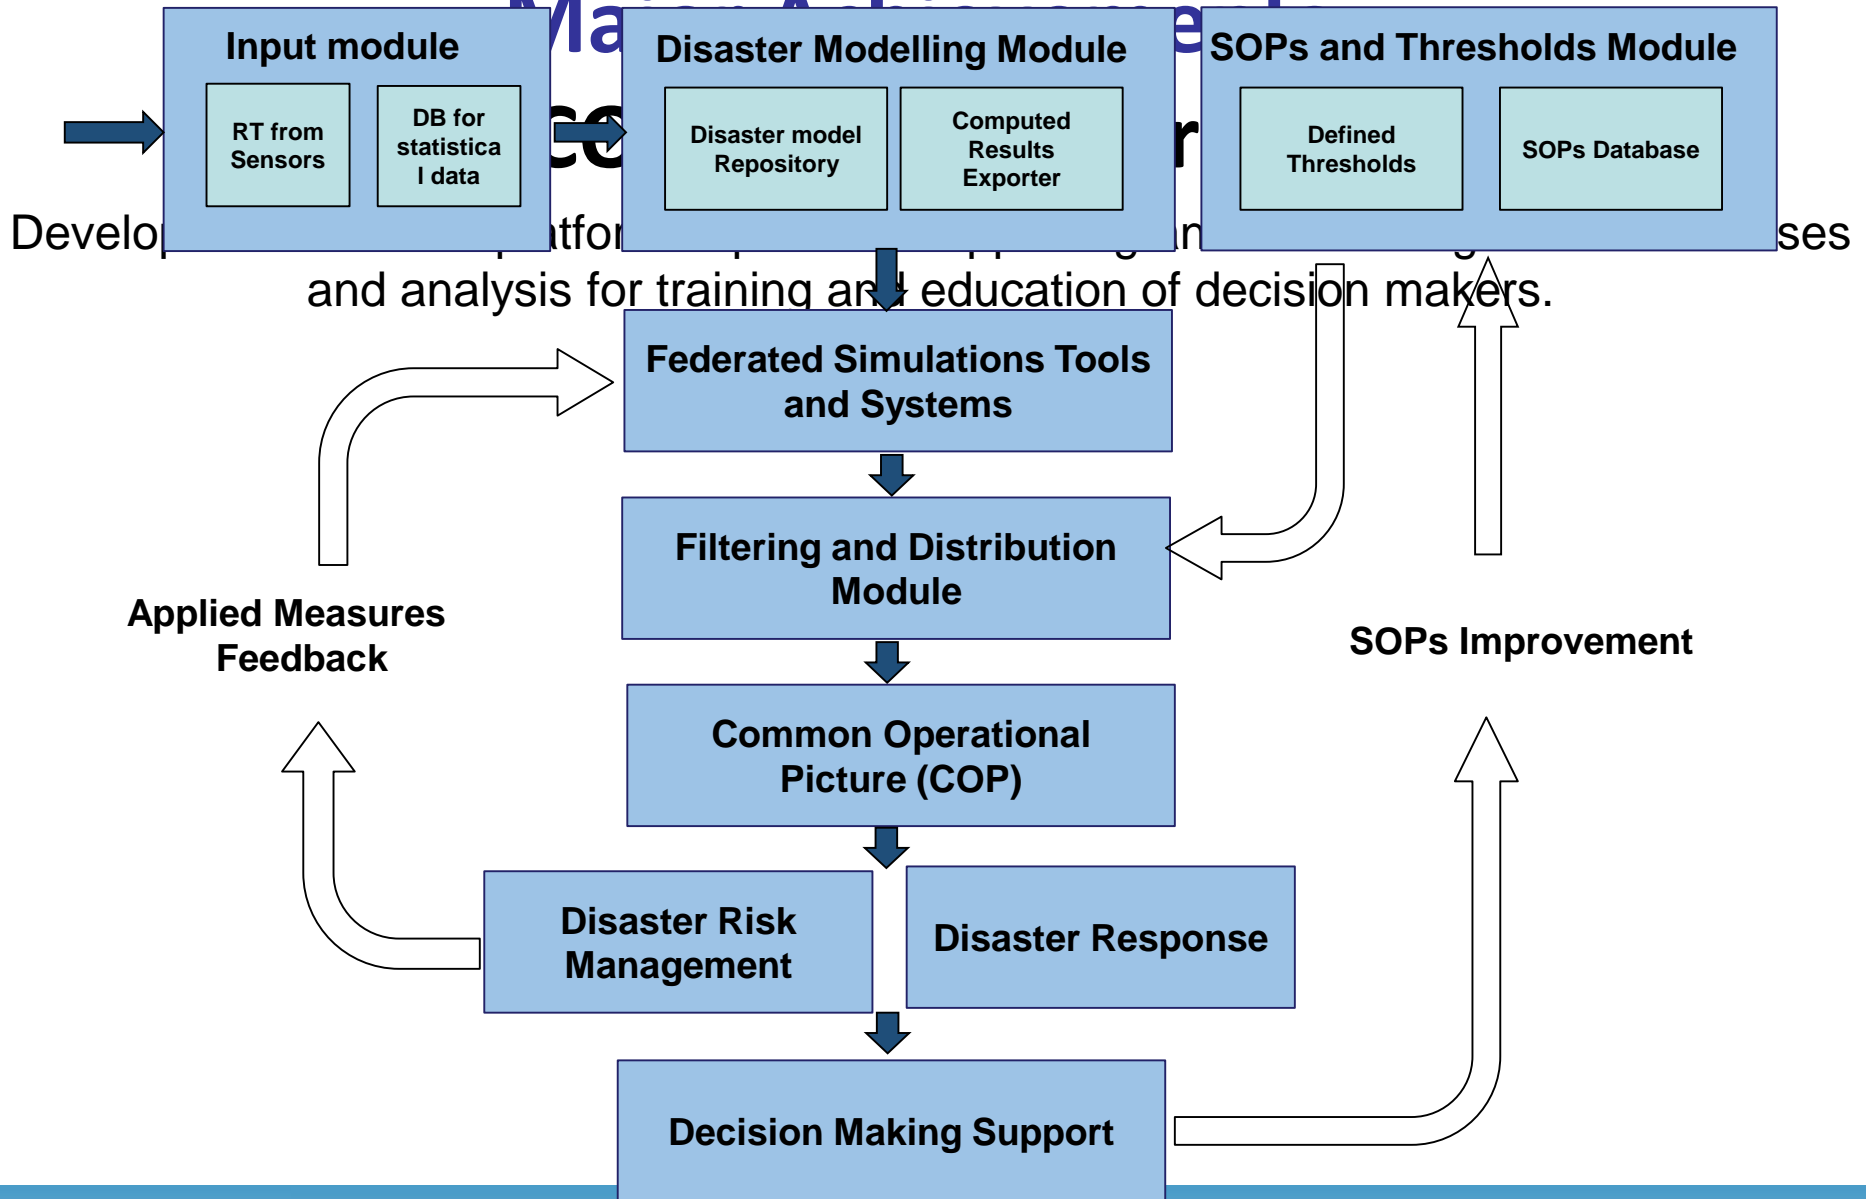

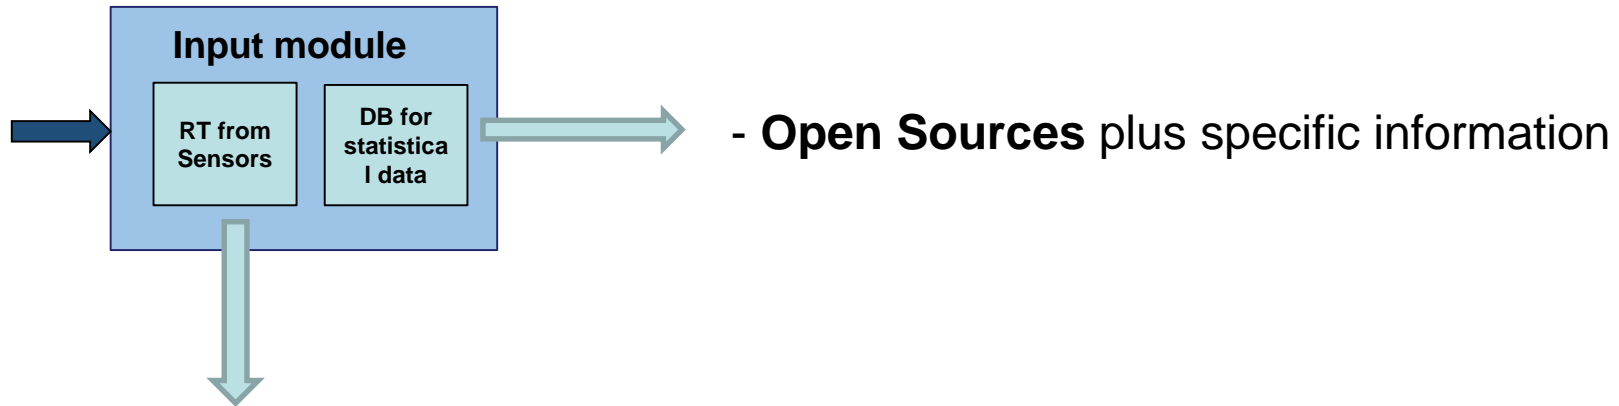

# Pictures from the LOEs

Units in the affected area (wildfire) in SWORD are visible in the affected area in IBM IOC.

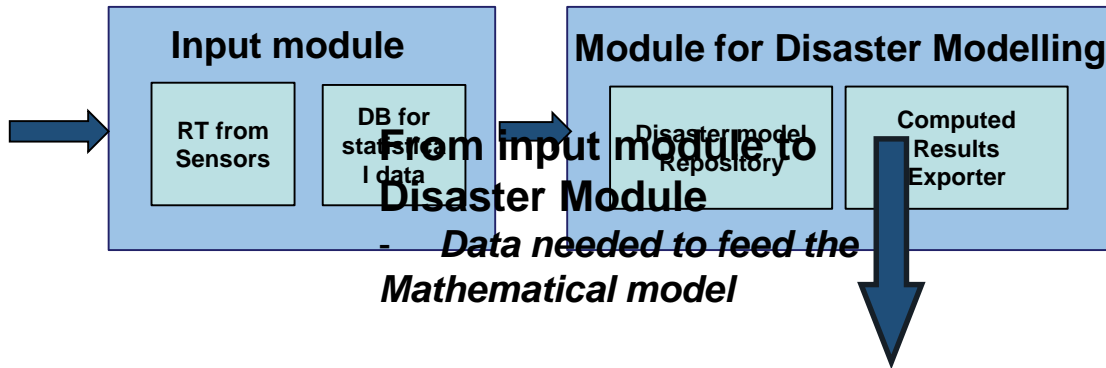

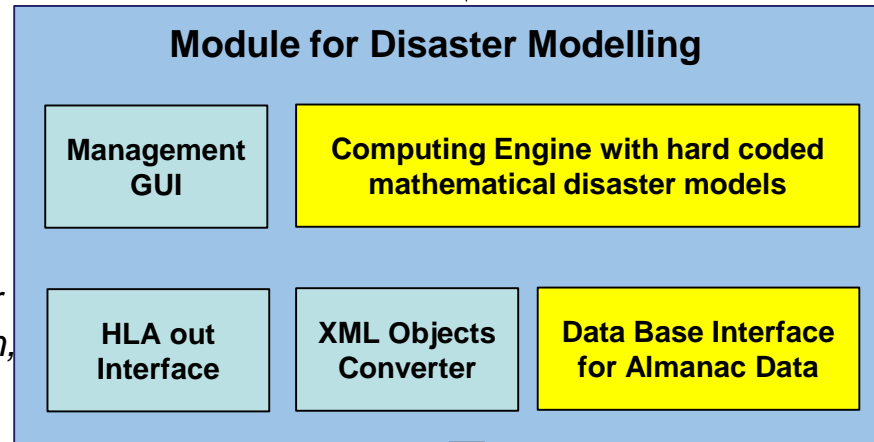

- **Automatic Sensors** – weather stations, river level, etc.

*CMDR COE has agreements with organizations for access of such real-time data:  
Mol, BAS, Military Academy, Bulgarian Armed Forces, Insurance companies, etc*

First developed module.  
Used to generate precise and objective vivid HLA object, representing disaster.

*The Operator choose the Model, set the parameters, refresh the rate, set the network*

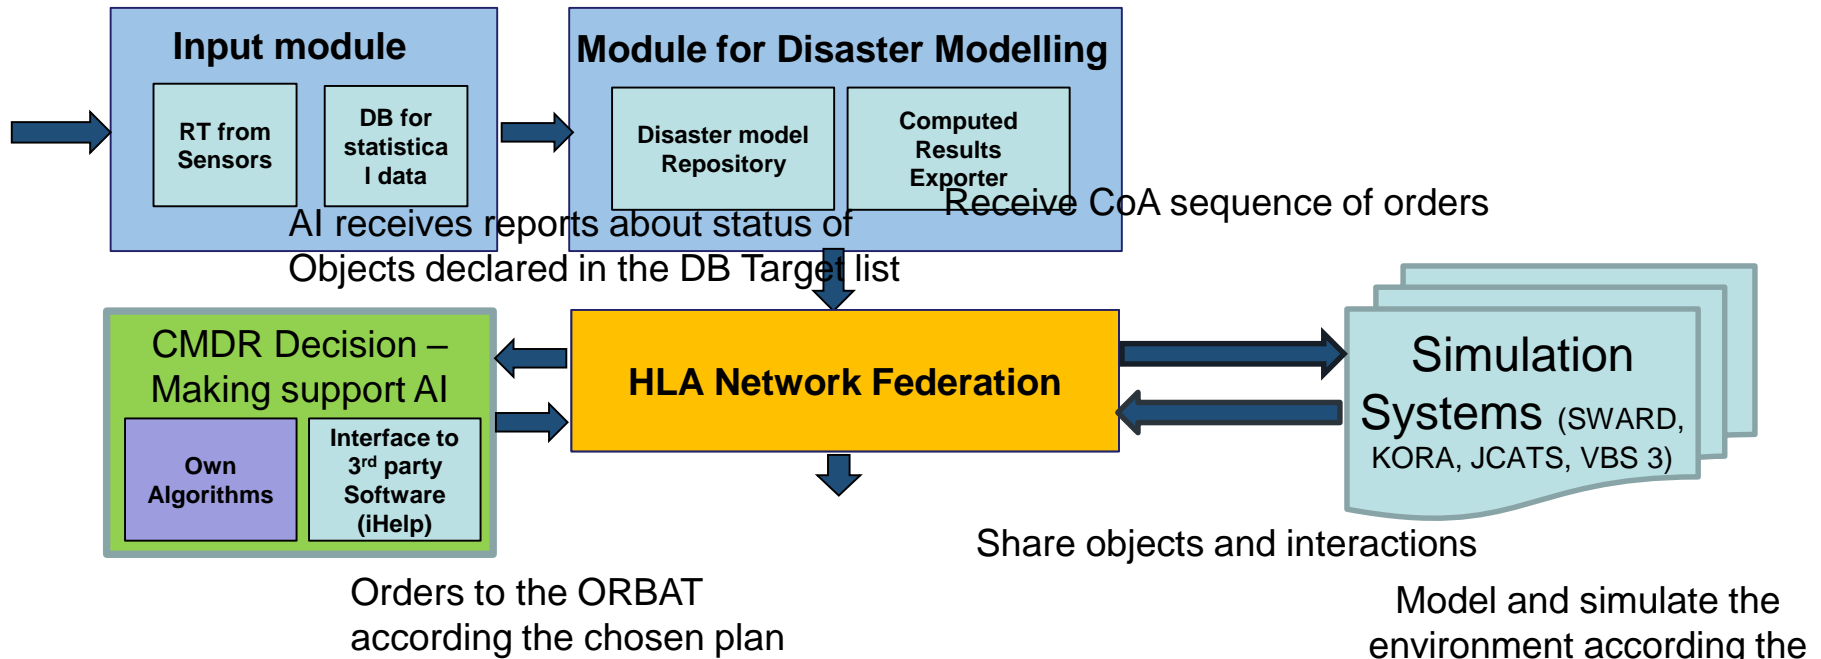

*Embedded Mathematical models with open equations and coefficients*

*Wrap the computed disaster as HLA object, join federation, Publish the object*

*Mostly constants and physical values*

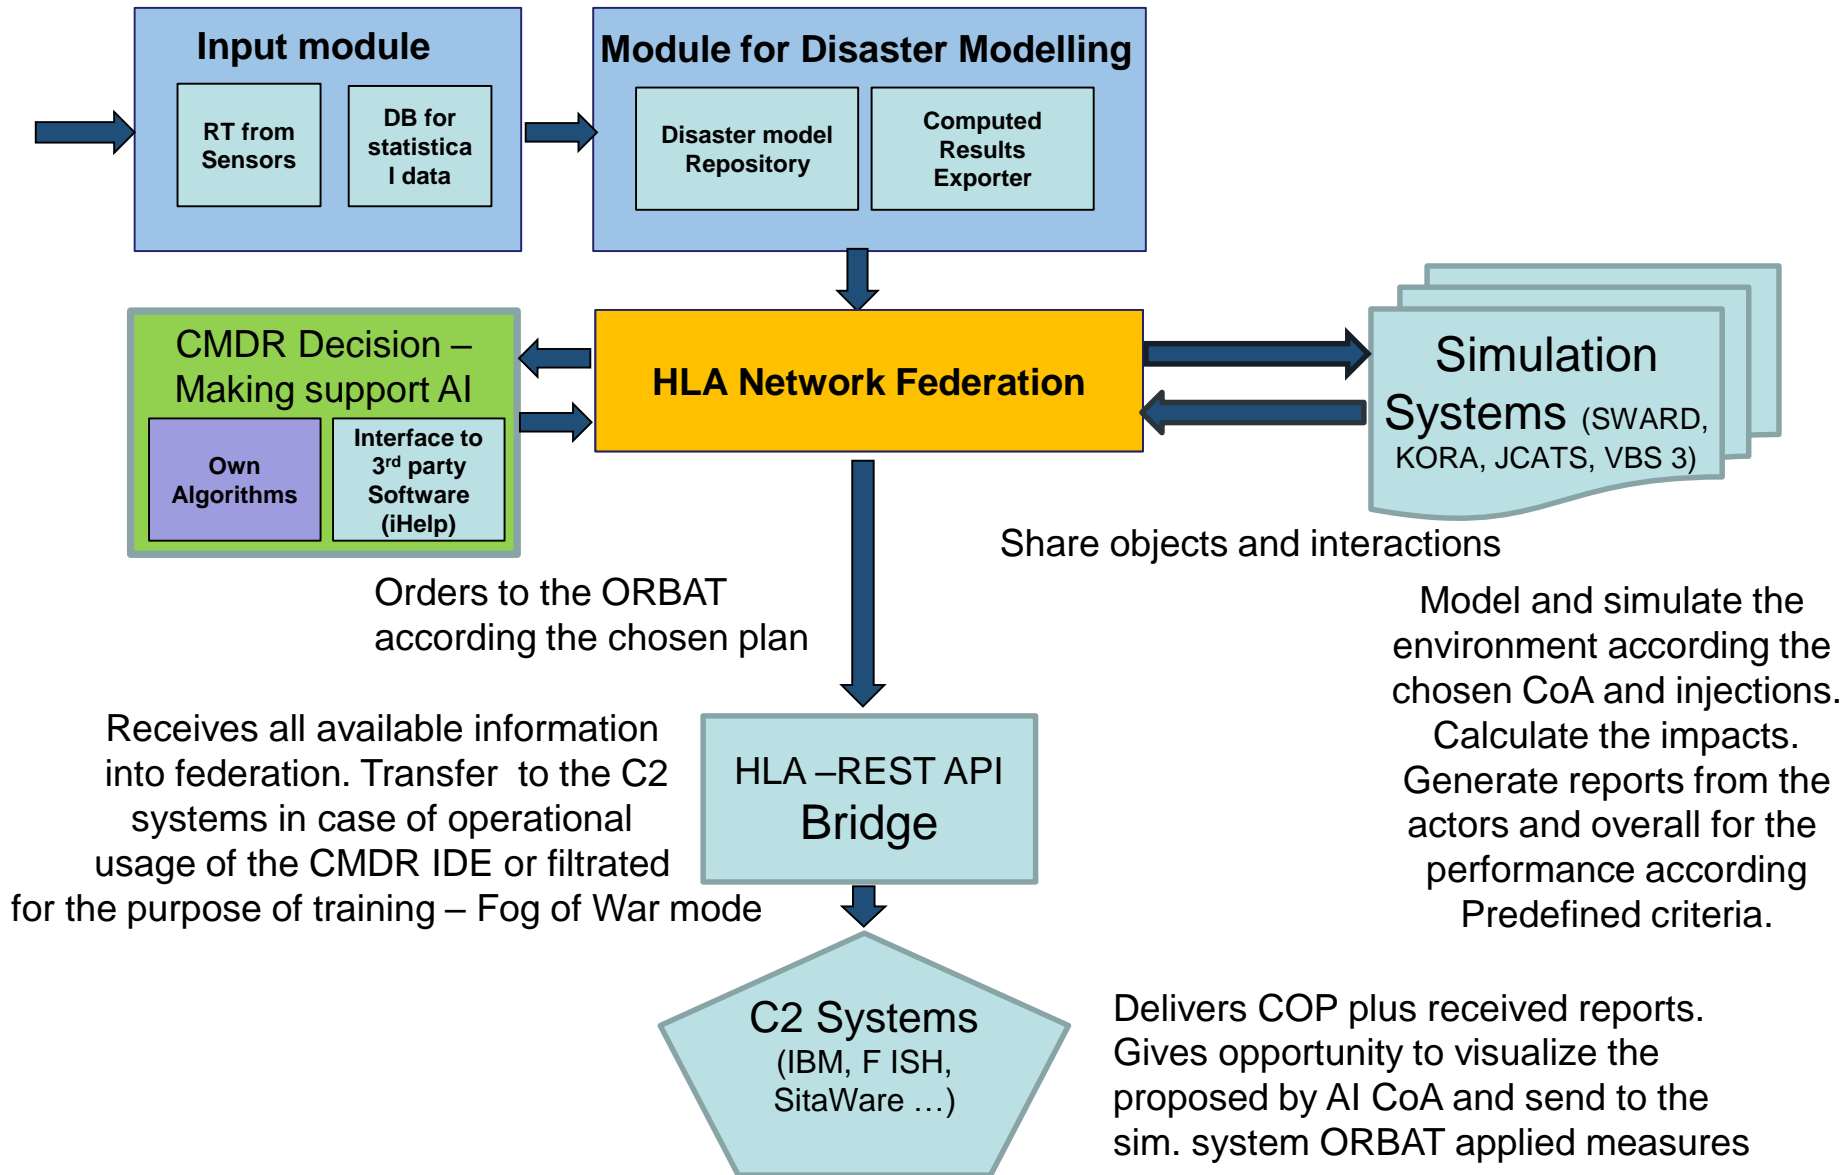

*Gets computed disaster from other modelling software (like HPAC)*

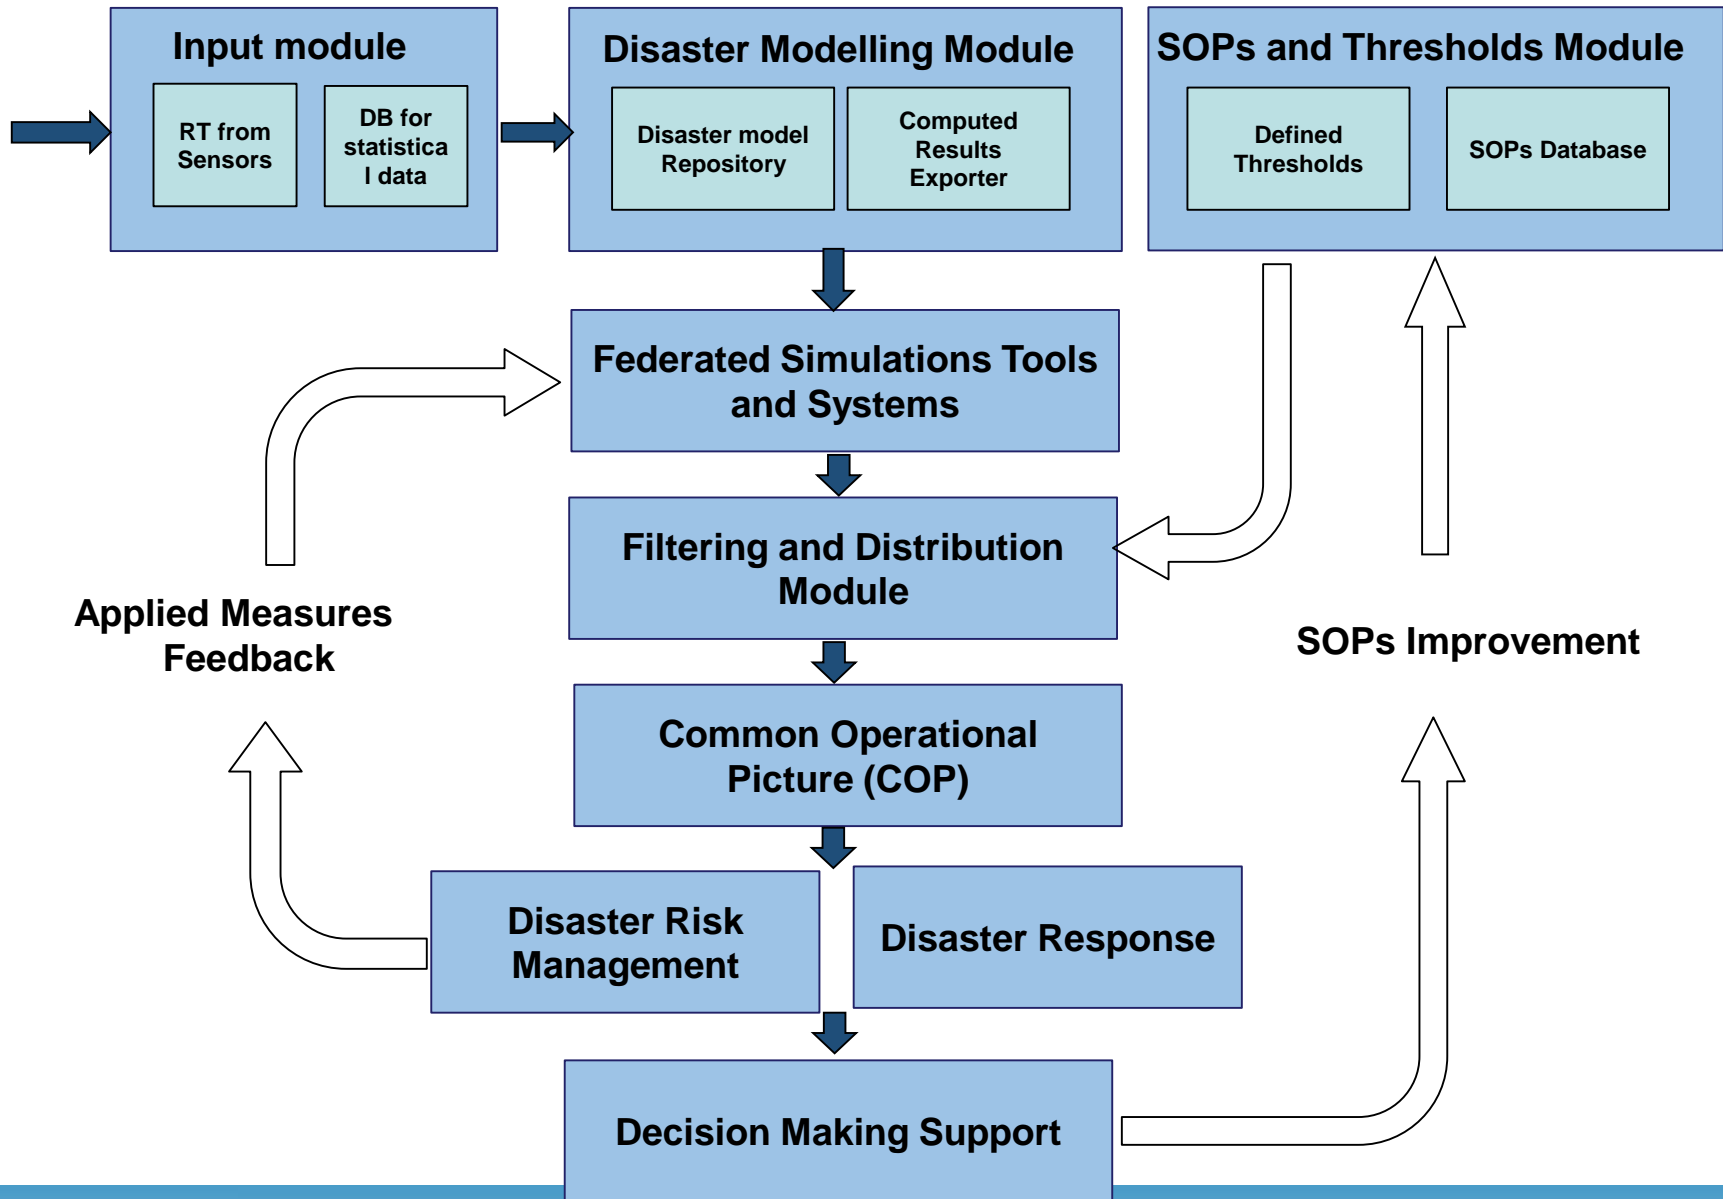

**Join federation and publish Disaster object/s**

Filtrates relevant response measures from the SOP DB according to the received data about impacted object from the Target List beyond the threshold. Sends proposal for CoA to the decision-maker. Receives confirmed measures and transfers them to orders.

Model and simulate the environment according the chosen CoA and injections. Calculate the impacts. Generate reports from the actors and overall for the performance according Predefined criteria.

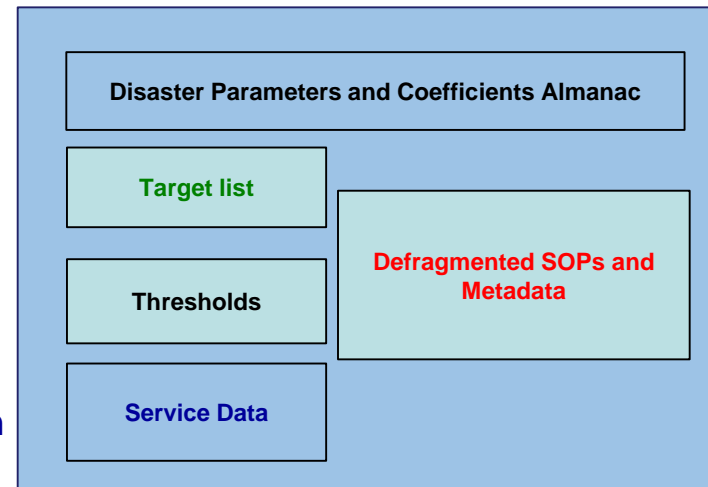

## SOPs and Thresholds Module

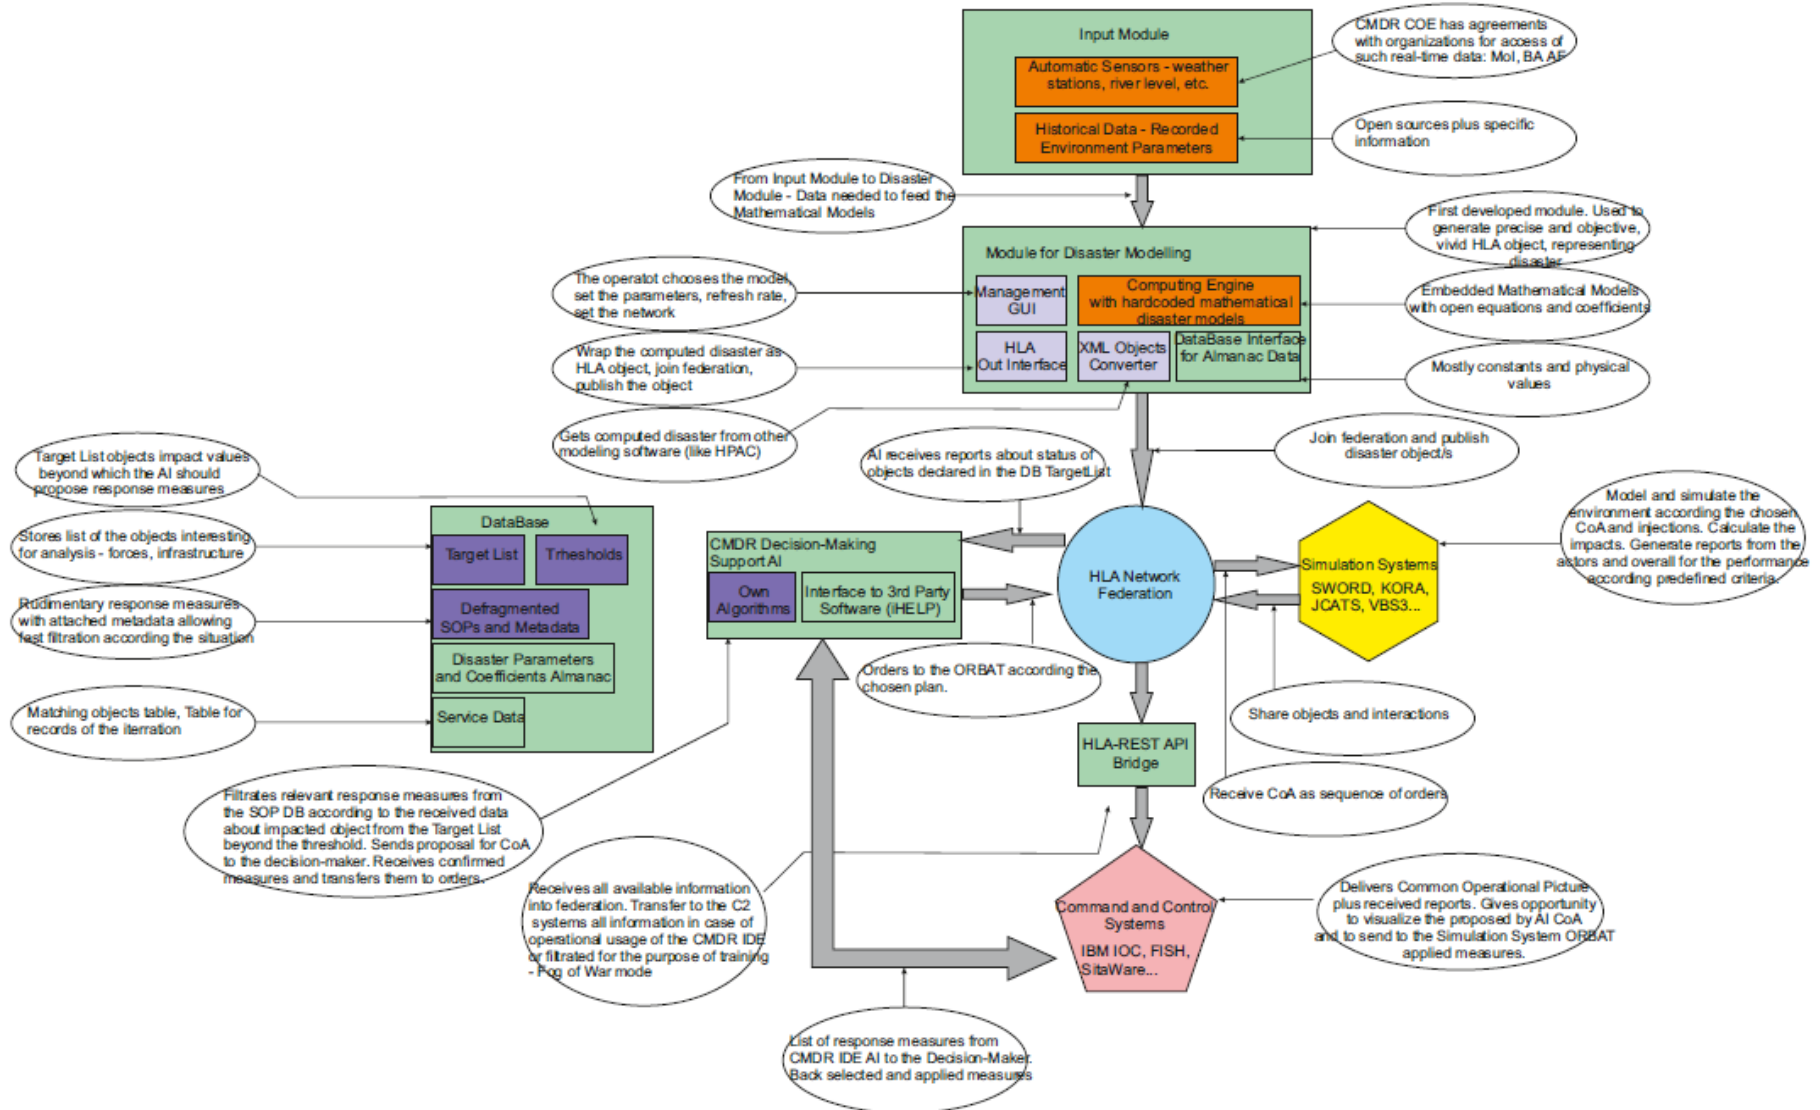

Stores list of the objects interesting for analysis - forces, infrastructure

Target List objects impact values beyond which the AI should propose response measures

Matching objects table, Table for records of the iteration

Rudimentary response measures with attached metadata allowing fast filtration according the situation

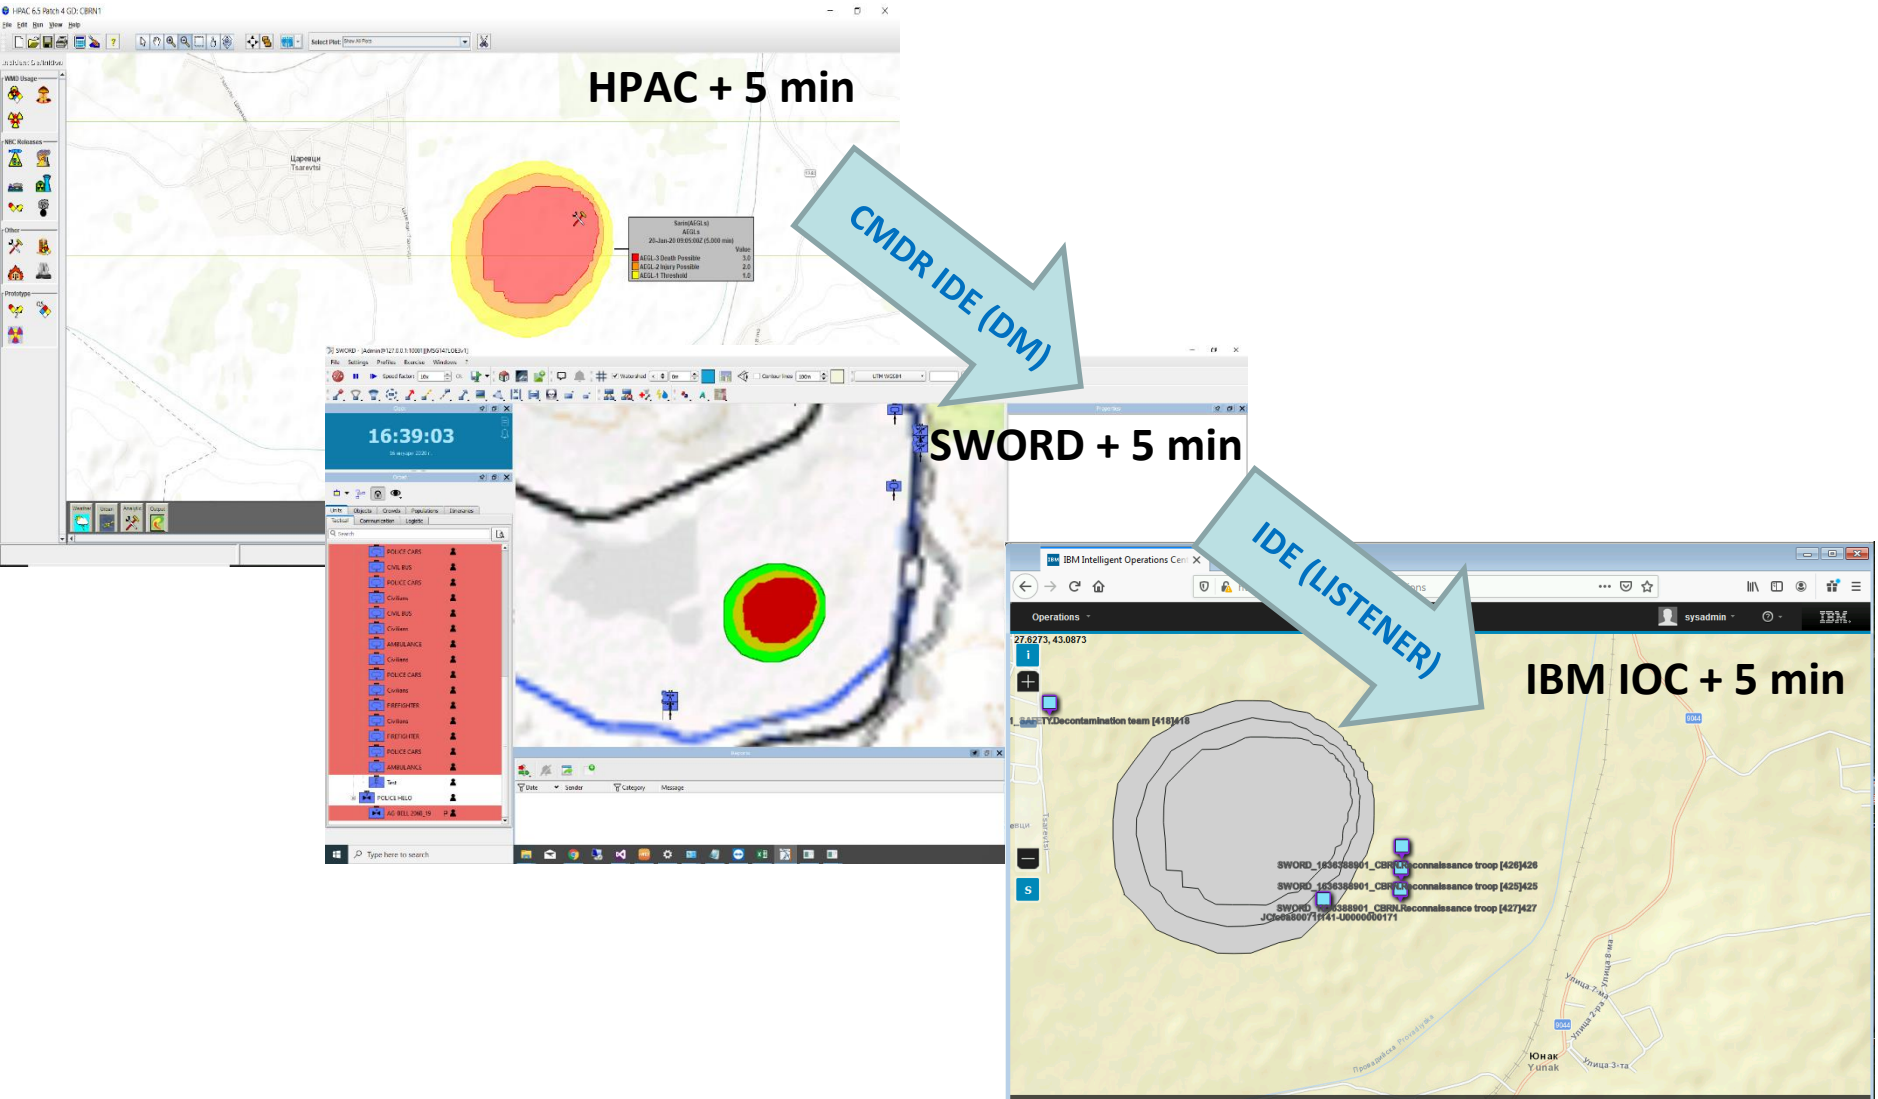

# Major Achievements:

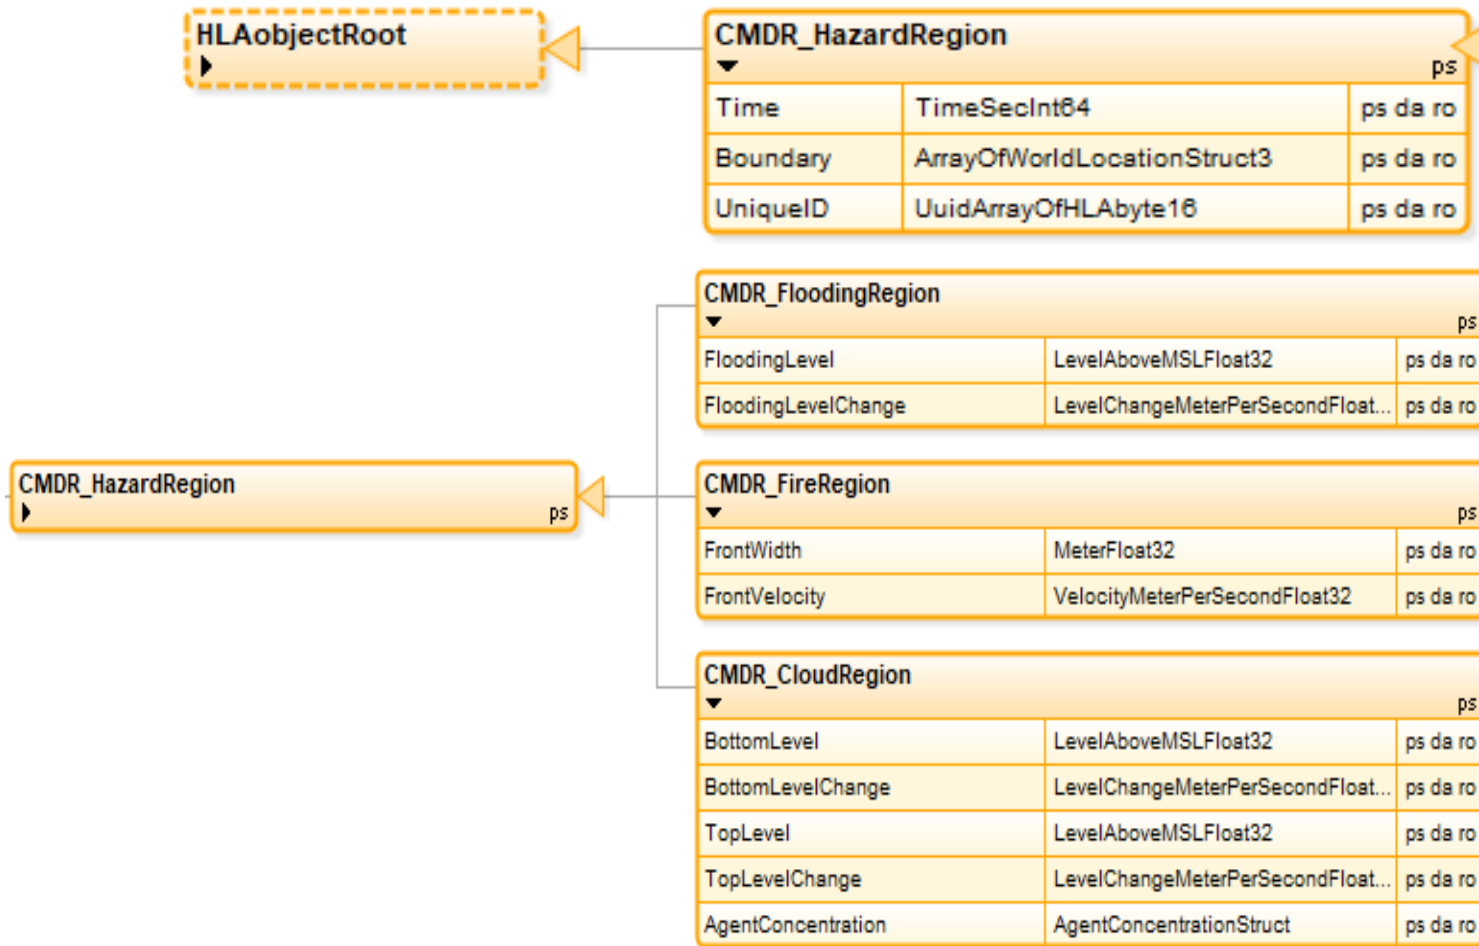

## CMDR COE IDE

- Developed CMDR Integrated Distributed Environment (IDE) software including:
  - Disaster module for implementing results from disasters models,
  - HLA Listener transferring data to C2 system,
  - Flooding, CBRN and Wildfire models
  - HLA Commander – transferring orders back to the HLA federated simulation system (under development)

# Plume transfer to IBM IOC

# Major Achievements: Flooding and Wildfire FOMs

## FINAL STATUS

### Major Achievements:

- Defined GAPS for the ACT M&S GAP Analysis report – disasters FOMs, Civ/Mil common COP for interactions
- Developed a technical platform capable of supporting and conducting CMDR exercises and analysis for training and education of decision makers.
- Developed Disaster FOMs:
  - Flooding
  - Wildfire
- Developed CMDR Integrated Distributed Environment (IDE) software including:
  - Disaster module for implementing results from disasters models,
  - HLA Listener transferring data to C2 system,
  - Flooding, CBRN and Wildfire models
  - HLA Commander – transferring orders back to the HLA federated simulation system (under development)
- Capabilities for NATO and National disasters training both for military and civilians.
- Initial Operational Capability for In-Theatre support, Reach Back and In-house analysis.
- Concept for CMDR COE (M&S Decision Making Support for CDMP and CCI) in accordance with NATO CD&E Methodology.
- 16 papers and presentations published and presented at various conferences

## Outlook for further research and development

- Application of the technical platform in context of CAX, decision-making support and training
- Selection of SOP by artificial intelligence
- Extension of CMDR IDE interoperability to accommodate more models
- Extension of the disaster module in CMDR IDE to deal with further disaster types
- Extension of the established disaster database
- Enhancement of C2-Systems capability to deal with dynamic disaster information
- Support of decision making capability by the use of drones as sensors and computer vision technology to augment in crisis data collection and situational awareness
- Augmentation of training by VR-training scenarios and/or gamification
- Establishment of a resilience assessment model for potential affected areas → Simulate resilience level of affected areas → Consult decision-makers based on estimated resilience levels of affected areas to recommend different courses of action during disasters
- Development of HLA Commander, transferring orders back to the HLA federated simulation system. The IABG not only developed FOM which standardized the transfer of information about disaster objects but also to handle and depict the disaster management (disaster related orders and reports).
- Development of a concept for CMDR COE (Disaster and Climate Change Implications on military activities) in accordance with NATO CD&E Methodology.

**NMSG-147 Conducting Limited Object Experiment 3  
20-24 January 2020, Sofia**
